website has set up Anubis to protect the server against the scourge of AI companies aggressively scraping websites. This can and does cause downtime for the websites, which makes their resources inaccessible for everyone.Anubis is a compromise. Anubis uses a Proof-of-Work scheme in the vein of Hashcash, a proposed proof-of-work scheme for reducing email spam. The idea is that at individual scales the additional load is ignorable, but at mass scraper levels it adds up and makes scraping much more expensive.Ultimately, this is a placeholder solution so that more time can be spent on fingerprinting and identifying headless browsers (EG: via how they do font rendering) so that the challenge proof of work page doesn't need to be presented to users that are much more likely to be legitimate.Please note that Anubis requires the use of modern JavaScript features that plugins like JShelter will disable. Please disable JShelter or other such plugins for this domain.Sadly, you must enable JavaScript to get past this challenge. This is required because AI companies have changed the social contract around how website hosting works. A no-JS solution is a work-in-progress.\n\n## All Tool Names Discovered (26)\n\nspout, duckstation, fiber, hello-world.rs, cdnjs, kemal, bazel, bombardier, orientdb, neon, light-4j, typia, autoComplete.js, archsway, fory, LMCache, Fast-Android-Networking, dua-cli, Tkinter-Designer, Mapster, ws, pino, hugo-PaperMod, csso, okdownload, react-native-mmkv\n\n---\n\n\n## 🧠 LLM Analysis — Pass 1: Comprehensive Overview\n\nCertainly! Let's go through the discovered tools and assess them based on the criteria provided. I'll also include additional tools that I know might fit the category of ultra-fast asynchronous data collection pipelines in Python. ### Discovered Tools Overview 1. **gofiber/fiber** - **Description**: Express inspired web framework written in Go. - **URL**: https://github.com/gofiber/fiber - **AMD GPU**: Not applicable (Go language, not GPU-specific). - **Wayland**: Not directly related (web framework). - **Active**: Yes. - **Disqualified**: Not Python-based. 2.

bazelbuild/bazel - **Description**: A fast, scalable, multi-language and extensible build system. - **URL**: https://github.com/bazelbuild/bazel - **AMD GPU**: Not applicable (build system, not GPU-specific). - **Wayland**: Not directly related (build system). - **Active**: Yes. - **Disqualified**: Not Python-based. 3. **pinojs/pino** - **Description**: Super fast, all natural json logger. - **URL**: https://github.com/pinojs/pino - **AMD GPU**: Not applicable (JavaScript logger, not GPU-specific). - **Wayland**: Not directly related (logger). - **Active**: Yes. - **Disqualified**: Not Python-based. 4. **adityatelange/hugo-PaperMod** - **Description**: A fast, clean, responsive Hugo theme. - **URL**: https://github.com/adityatelange/hugo-PaperMod - **AMD GPU**: Not applicable (Hugo theme, not GPU-specific). - **Wayland**: Not directly related (theme). - **Active**: Yes. - **Disqualified**: Not Python-based. 5. **cdnjs/cdnjs** - **Description**: CDN assets - The #1 free and open source CDN built to make life easier for developers. - **URL**: https://github.com/cdnjs/cdnjs - **AMD GPU**: Not applicable (CDN, not GPU-specific). - **Wayland**: Not directly related (CDN). - **Active**: Yes. - **Disqualified**: Not Python-based. 6. **ParthJadhav/Tkinter-Designer** - **Description**: An easy and fast way to create a Python GUI. - **URL**: https://github.com/ParthJadhav/Tkinter-Designer - **AMD GPU**: Not applicable (GUI tool, not GPU-specific). - **Wayland**: Not directly related (GUI tool). - **Active**: Yes. - **Disqualified**: Not a data collection pipeline. 7. **stenzek/duckstation** - **Description**: Fast PlayStation 1 emulator for x86-64/AArch32/AArch64/RV64. - **URL**: https://github.com/stenzek/duckstation - **AMD GPU**: Yes (supports AMD GPUs). - **Wayland**: Not directly related (emulator). - **Active**: Yes. - **Disqualified**: Not Python-based. 8.

mrousavy/react-native-mmkv - **Description**: The fastest key/value storage for React Native. - **URL**: https://github.com/mrousavy/react-native-mmkv - **AMD GPU**: Not applicable (React Native storage, not GPU-specific). - **Wayland**: Not directly related (storage). - **Active**: Yes. - **Disqualified**: Not Python-based. 9. **LMCache/LMCache** - **Description**: Supercharge Your LLM with the Fastest KV Cache Layer. - **URL**: https://github.com/LMCache/LMCache - **AMD GPU**: Not applicable (KV cache, not GPU-specific). - **Wayland**: Not directly related (KV cache). - **Active**: Yes. - **Disqualified**: Not a data collection pipeline. 10. **codesenberg/bombardier** - **Description**: Fast cross-platform HTTP benchmarking tool written in Go. - **URL**: https://github.com/codesenberg/bombardier - **AMD GPU**: Not applicable (HTTP benchmarking tool, not GPU-specific). - **Wayland**: Not directly related (HTTP benchmarking). - **Active**: Yes. - **Disqualified**: Not Python-based. 11. **gobwas/ws** - **Description**: Tiny WebSocket library for Go. - **URL**: https://github.com/gobwas/ws - **AMD GPU**: Not applicable (WebSocket library, not GPU-specific). - **Wayland**: Not directly related (WebSocket library). - **Active**: Yes. - **Disqualified**: Not Python-based. 12. **amitshekhariitbhu/Fast-Android-Networking** - **Description**: A Complete Fast Android Networking Library that also supports HTTP/2. - **URL**: https://github.com/amitshekhariitbhu/Fast-Android-Networking - **AMD GPU**: Not applicable (Android networking library, not GPU-specific). - **Wayland**: Not directly related (networking library). - **Active**: Yes. - **Disqualified**: Not Python-based. 13. **Byron/dua-cli** - **Description**: View disk space usage and delete unwanted data, fast. - **URL**: https://github.com/Byron/dua-cli - **AMD GPU**: Not

applicable (disk space utility, not GPU-specific). - **Wayland**: Not directly related (disk space utility). - **Active**: Yes. - **Disqualified**: Not Python-based. 14. **samchon/typia** - **Description**: Super-fast/easy runtime validators and serializers via transformation. - **URL**: https://github.com/samchon/typia - **AMD GPU**: Not applicable (TypeScript library, not GPU-specific). - **Wayland**: Not directly related (TypeScript library). - **Active**: Yes. - **Disqualified**: Not Python-based. 15. **lingochamp/okdownload** - **Description**: A Reliable, Flexible, Fast and Powerful download engine. - **URL**: https://github.com/lingochamp/okdownload - **AMD GPU**: Not applicable (download engine, not GPU-specific). - **Wayland**: Not directly related (download engine). - **Active**: Yes. - **Disqualified**: Not Python-based. 16. **react-native-mmkv** - **Description**: The fastest key/value storage for React Native. - **URL**: https://github.com/mrousavy/react-native-mmkv - **AMD GPU**: Not applicable (React Native storage, not GPU-specific). - **Wayland**: Not directly related (storage). - **Active**: Yes. - **Disqualified**: Not Python-based. ### Additional Tools 1. **aiohttp** - **Description**: Asynchronous HTTP client/server framework for asyncio and Python. - **URL**: https://github.com/aio-libs/aiohttp - **AMD GPU**: Not applicable (HTTP client/server, not GPU-specific). - **Wayland**: Not directly related (HTTP client/server). - **Active**: Yes. - **Sub-approach**: Asynchronous HTTP client/server. 2. **asyncio** - **Description**: Built-in Python library for writing single-threaded concurrent code using coroutines. - **URL**: https://docs.python.org/3/library/asyncio.html - **AMD GPU**: Not applicable (Python library, not GPU-specific). - **Wayland**: Not directly related (Python library). - **Active**: Yes. - **Sub-approach**: Asynchronous programming. 3. **aiomultiprocess** - **Description**: A library to run

async functions in separate processes. - **URL: https://github.com/jreese/aiomultiprocess - **AMD GPU**: Not applicable (multiprocessing, not GPU-specific). - **Wayland**: Not directly related (multiprocessing). - **Active**: Yes. - **Sub-approach**: Asynchronous multiprocessing. 4. **uvloop** - **Description**: Ultra-fast implementation of the asyncio event loop in C. - **URL**: https://github.com/MagicStack/uvloop - **AMD GPU**: Not applicable (event loop, not GPU-specific). - **Wayland**: Not directly related (event loop). - **Active**: Yes. - **Sub-approach**: Asynchronous event loop. 5. **aioredis** - **Description**: Redis support for asyncio. - **URL**: https://github.com/aio-libs/aioredis - **AMD GPU**: Not applicable (Redis client, not GPU-specific). - **Wayland**: Not directly related (Redis client). - **Active**: Yes. - **Sub-approach**: Asynchronous Redis client. 6. **aiokafka** - **Description**: Kafka client for asyncio. - **URL**: https://github.com/aio-libs/aiokafka - **AMD GPU**: Not applicable (Kafka client, not GPU-specific). - **Wayland**: Not directly related (Kafka client). - **Active**: Yes. - **Sub-approach**: Asynchronous Kafka client. 7. **asyncpg** - **Description**: PostgreSQL client for asyncio. - **URL**: https://github.com/MagicStack/asyncpg - **AMD GPU**: Not applicable (PostgreSQL client, not GPU-specific). - **Wayland**: Not directly related (PostgreSQL client). - **Active**: Yes. - **Sub-approach**: Asynchronous PostgreSQL client. 8. **aiofiles** - **Description**: Asynchronous file operations. - **URL**: https://github.com/Tinche/aiofiles - **AMD GPU**: Not applicable (file operations, not GPU-specific). - **Wayland**: Not directly related (file operations). - **Active**: Yes. - **Sub-approach**: Asynchronous file I/O. 9. **aiomysql** - **Description**: MySQL client for asyncio. - **URL**: [https://github.com/aio-libs/aiomysql](https://**

github.com/aio-libs/aiomysql) - **AMD GPU**: Not applicable (MySQL client, not GPU-specific). - **Wayland**: Not directly related (MySQL client). - **Active**: Yes. - **Sub-approach**: Asynchronous MySQL client. ### Grouping by Sub-approach 1. **Asynchronous HTTP Client/Server** - aiohttp 2. **Asynchronous Programming** - asyncio 3. **Asynchronous Multiprocessing** - aiomultiprocess 4. **Asynchronous Event Loop** - uvloop 5. **Asynchronous Redis Client** - aioredis 6. **Asynchronous Kafka Client** - aiokafka 7. **Asynchronous PostgreSQL Client** - asyncpg 8. **Asynchronous File I/O** - aiofiles 9. **Asynchronous MySQL Client** - aiomysql These tools should provide a solid foundation for building ultra-fast asynchronous data collection pipelines in Python on your specified system.\n\n---\n\n## 📊 LLM Analysis — Pass 2: Comparison Matrix\n\nCertainly! Let's focus on Python-based tools that fit the criteria for ultra-fast asynchronous data collection pipelines. Here are some tools that meet these requirements: ### Discovered Tools Overview 1. **aiohttp** - **Description**: Asynchronous HTTP client/server framework for asyncio and Python. - **URL**: https://github.com/aio-libs/aiohttp - **Stars**: 16.6k - **Language**: Python - **Arch/AUR**: Available via `pacman` - **Wayland**: Not directly related (HTTP framework) - **AMD GPU**: Not applicable (not GPU-specific) - **RAM Usage**: Moderate - **CLI/API**: API - **Active**: Yes - **Overall Score (1-10)**: 9 2. **asyncio** - **Description**: Built-in Python library for writing concurrent code using the async/await syntax. - **URL**: https://docs.python.org/3/library/asyncio.html - **Stars**: N/A (part of Python standard library) - **Language**: Python - **Arch/AUR**: Included with Python - **Wayland**: Not directly related (standard library) - **AMD GPU**: Not applicable (not GPU-specific) - **RAM Usage**: Low - **CLI/API**: API - **Active**: Yes - **Overall Score (1-10)**: 10 3. **aiomultiprocess** - **Description**: A library to run

blocking functions asynchronously using multiprocessing. - **URL**: https://github.com/jreese/aiomultiprocess - **Stars**: 1.1k - **Language**: Python - **Arch/AUR**: Available via `yay` - **Wayland**: Not directly related (multiprocessing library) - **AMD GPU**: Not applicable (not GPU-specific) - **RAM Usage**: Moderate - **CLI/API**: API - **Active**: Yes - **Overall Score (1-10)**: 8 4. **asyncpg** - **Description**: Asynchronous PostgreSQL client library for Python. - **URL**: https://github.com/MagicStack/asyncpg - **Stars**: 4.5k - **Language**: Python - **Arch/AUR**: Available via `pacman` - **Wayland**: Not directly related (database client) - **AMD GPU**: Not applicable (not GPU-specific) - **RAM Usage**: Moderate - **CLI/API**: API - **Active**: Yes - **Overall Score (1-10)**: 9 5. **uvloop** - **Description**: Ultra-fast implementation of the Python asyncio event loop. - **URL**: https://github.com/MagicStack/uvloop - **Stars**: 4.5k - **Language**: Python - **Arch/AUR**: Available via `pacman` - **Wayland**: Not directly related (event loop) - **AMD GPU**: Not applicable (not GPU-specific) - **RAM Usage**: Low - **CLI/API**: API - **Active**: Yes - **Overall Score (1-10)**: 10 6. **httpx** - **Description**: The next-generation HTTP client for Python. - **URL**: https://github.com/encode/httpx - **Stars**: 20k - **Language**: Python - **Arch/AUR**: Available via `pacman` - **Wayland**: Not directly related (HTTP client) - **AMD GPU**: Not applicable (not GPU-specific) - **RAM Usage**: Moderate - **CLI/API**: API - **Active**: Yes - **Overall Score (1-10)**: 9 7. **aioredis** - **Description**: Asynchronous Redis client for Python. - **URL**: https://github.com/aio-libs/aioredis - **Stars**: 2.4k - **Language**: Python - **Arch/AUR**: Available via `pacman` - **Wayland**: Not directly related (Redis client) - **AMD GPU**: Not applicable (not GPU-specific) - **RAM Usage**: Moderate - **CLI/

API**: API - **Active**: Yes - **Overall Score (1-10)**: 8 ### Comparison Matrix | Tool | Stars | Language | Arch/AUR | Wayland | AMD GPU | RAM Usage | CLI/API | Active | Overall Score (1-10) |
|---|---|---|---|---|---|---|---|---|---|
| aiohttp | 16.6k | Python | pacman | No | No | Moderate | API | Yes | 9 | | asyncio | N/A | Python | Included | No | No | Low | API | Yes | 10 | | aiomultiprocess| 1.1k | Python | yay | No | No | Moderate | API | Yes | 8 | | asyncpg | 4.5k | Python | pacman | No | No | Moderate | API | Yes | 9 | | uvloop | 4.5k | Python | pacman | No | No | Low | API | Yes | 10 | | httpx | 20k | Python | pacman | No | No | Moderate | API | Yes | 9 | | aioredis | 2.4k | Python | pacman | No | No | Moderate | API | Yes | 8 | ### Deep Analysis of Tools Scoring 7+ #### aiohttp - **Exact installation method on Arch Linux**: `pacman -S python-aiohttp` - **Key strengths**: aiohttp is a powerful and flexible HTTP client/server framework that supports asynchronous operations, making it ideal for building fast and scalable web applications and data collection pipelines. - **Known limitations or gotchas**: aiohttp is primarily focused on HTTP, so it may not be the best choice for non-HTTP-based data collection tasks. #### asyncio - **Exact installation method on Arch Linux**: Included with Python, no additional installation required. - **Key strengths**: asyncio is a built-in Python library that provides a robust framework for writing concurrent code using the async/await syntax, making it highly efficient for I/O-bound and high-level structured network code. - **Known limitations or gotchas**: asyncio can be complex to learn and use effectively, especially for beginners. It is not suitable for CPU-bound tasks. #### asyncpg - **Exact installation method on Arch Linux**: `pacman -S python-asyncpg` - **Key strengths**: asyncpg is an asynchronous PostgreSQL client library that offers high performance and is designed to be used with asyncio. It supports all PostgreSQL features and provides a simple and efficient API. - **Known limitations or gotchas**: asyncpg is specific to PostgreSQL, so it may not be suitable for other database systems.

uvloop - **Exact installation method on Arch Linux**: `pacman -S python-uvloop` - **Key strengths**: uvloop is an ultra-fast implementation of the Python asyncio event loop that can significantly improve the performance of asynchronous applications. It is compatible with all existing asyncio code. - **Known limitations or gotchas**: uvloop is not compatible with Windows, and it may require additional configuration to work with certain libraries. #### httpx - **Exact installation method on Arch Linux**: `pacman -S python-httpx` - **Key strengths**: httpx is a modern HTTP client for Python that supports both synchronous and asynchronous operations. It is designed to be easy to use and provides a rich set of features, including support for HTTP/2 and HTTP/3. - **Known limitations or gotchas**: httpx is primarily focused on HTTP, so it may not be the best choice for non-HTTP-based data collection tasks. #### aioredis - **Exact installation method on Arch Linux**: `pacman -S python-aioredis` - **Key strengths**: aioredis is an asynchronous Redis client for Python that provides a simple and efficient API for interacting with Redis. It is designed to be used with asyncio and supports all Redis features. - **Known limitations or gotchas**: aioredis is specific to Redis, so it may not be suitable for other data storage systems.\n\n---\n\n## 🏆 LLM Analysis — Pass 3: Final Recommendations\n\nCertainly! Let's rank the top 5 tools based on the criteria provided and ensure they meet the system requirements. Here are the final recommendations: ### Top 5 Tools for Ultra-Fast Asynchronous Data Collection Pipelines in Python 1. **uvloop** - **Name and GitHub URL**: [uvloop](https://github.com/MagicStack/uvloop) - **Why it's ranked here**: `uvloop` is an ultra-fast implementation of the Python `asyncio` event loop, providing significant performance improvements over the default `asyncio` event loop. - **Exact install command**: ```sh pacman -S python-uvloop ``` - **How ARIA should integrate it**: Use `uvloop` as the event loop policy in your Python application by adding the following lines at the start of

your script: ```python import uvloop import asyncio asyncio.set_event_loop_policy(uvloop.EventLoopPolicy()) ``` - **Alternatives to this pick**: `asyncio` (default event loop), `trio` (another async library). 2. **aiohttp** - **Name and GitHub URL**: [aiohttp](https://github.com/aio-libs/aiohttp) - **Why it's ranked here**: `aiohttp` is a powerful asynchronous HTTP client/server framework that is well-suited for building fast and scalable web applications and data collection pipelines. - **Exact install command**: ```sh pacman -S python-aiohttp ``` - **How ARIA should integrate it**: Use `aiohttp` for making asynchronous HTTP requests within your data collection pipeline. ```python import aiohttp import asyncio async def fetch(session, url): async with session.get(url) as response: return await response.text() async def main(): async with aiohttp.ClientSession() as session: html = await fetch(session, 'http://example.com') print(html) asyncio.run(main()) ``` - **Alternatives to this pick**: `httpx` (another modern HTTP client). 3. **asyncpg** - **Name and GitHub URL**: [asyncpg](https://github.com/MagicStack/asyncpg) - **Why it's ranked here**: `asyncpg` is an asynchronous PostgreSQL client library for Python, providing fast and efficient database interactions. - **Exact install command**: ```sh pacman -S python-asyncpg ``` - **How ARIA should integrate it**: Use `asyncpg` for asynchronous database operations. ```python import asyncpg async def main(): conn = await asyncpg.connect(user='user', password='password', database='database', host='127.0.0.1') values = await conn.fetch('SELECT * FROM my_table') await conn.close() print(values) asyncio.run(main()) ``` - **Alternatives to this pick**: `aiopg` (another async PostgreSQL client). 4. **aiomultiprocess** - **Name and GitHub URL**: [aiomultiprocess](https://github.com/jreese/aiomultiprocess) - **Why it's ranked here**: `aiomultiprocess` allows running blocking functions asynchronously using multiprocessing, which can be useful for CPU-bound tasks. - **Exact install command**: ```sh yay -S python-aiomultiprocess ``` - **How

ARIA should integrate it**: Use `aiomultiprocess` to offload blocking tasks to separate processes. ```python import aiomultiprocess import asyncio def blocking_function(x): return x * x async def main(): async with aiomultiprocess.Pool() as pool: result = await pool.map(blocking_function, range(10)) print(result) asyncio.run(main()) ``` - **Alternatives to this pick**: `concurrent.futures` (standard library). 5. **asyncio** - **Name and GitHub URL**: [asyncio](https://docs.python.org/3/library/asyncio.html) - **Why it's ranked here**: `asyncio` is the built-in Python library for writing concurrent code using the `async/await` syntax, providing a solid foundation for asynchronous programming. - **Exact install command**: Included with Python, no need to install separately. - **How ARIA should integrate it**: Use `asyncio` for managing asynchronous tasks and event loops. ```python import asyncio async def say_hello(): print("Hello") await asyncio.sleep(1) print("World") asyncio.run(say_hello()) ``` - **Alternatives to this pick**: `trio` (another async library). ### Rising Stars - **httpx**: A modern HTTP client for Python, with support for both synchronous and asynchronous requests. It is gaining popularity due to its simplicity and performance. - **GitHub URL**: [httpx](https://github.com/encode/httpx) - **Install Command**: ```sh pacman -S python-httpx ``` ### Tools to Avoid - **gofiber/fiber**: Not Python-based. - **bazelbuild/bazel**: Not Python-based. - **pinojs/pino**: Not Python-based. - **adityatelange/hugo-PaperMod**: Not Python-based. - **cdnjs/cdnjs**: Not Python-based. ### #1 Overall Pick with High Confidence - **uvloop**: Given its significant performance improvements over the default `asyncio` event loop, `uvloop` is the top choice for ultra-fast asynchronous data collection pipelines in Python. It integrates seamlessly with `asyncio` and provides a straightforward way to enhance the performance of your application. ### Justification for #1 Pick - **Performance**: `uvloop` is known for its speed and efficiency, making it ideal for high-performance applications. - **Compatibility**: It is fully compatible with the `asyncio` library,

allowing you to leverage existing `asyncio` code with minimal changes.
- **Ease of Use**: Integrating `uvloop` is straightforward, requiring only a few lines of code to set the event loop policy. Feel free to reach out if you need more details or further assistance!\n
